EC MEDIUM (7206)

Intended Use
EC Medium is used for the detection of coliform bacteria at 37°C and Escherichia coli at elevated temperatures (44.5 and 45.5°C) in a laboratory setting. EC Medium is not intended for use in the diagnosis of disease or other conditions in humans.

Product Summary and Explanation
EC Medium was developed by Hajna and Perry in an effort to improve the methods for the detection of the coliform group and E. coli. This medium consists of a buffered lactose broth with the addition of 0.15% Bile Salts Mixture. Growth of spore-forming bacteria and fecal streptococci are inhibited by the bile salts, while growth of E. coli is enhanced by its presence. This medium can be used at 37°C for the detection of coliform organisms or at 44.5 or 45.5°C for the isolation of E. coli.

EC Medium is employed in elevated-temperature tests for distinguishing organisms of the total coliform group that also belong to the fecal coliform group. The fecal coliform test, using EC Medium, is applicable to investigations of drinking water, stream pollution, raw water sources, wastewater treatment systems, bathing waters, seawaters, and general water-quality monitoring. EC Medium is used in the MPN (Most Probable Number) test for fecal coliforms. EC Medium should not be used for the direct isolation of coliforms; prior enrichment in presumptive media is required for optimum recovery of fecal coliforms. EC Medium is used in methods for food and water testing.

Principles of the Procedure
Tryptose, a mixed enzymatic digest of protein, provides nitrogen, vitamins, and amino acids in EC Medium. Lactose is the carbon source. Bile Salts Mixture is the selective agent against Gram-positive bacteria, particularly bacilli and fecal streptococci. Dipotassium Phosphate and Monopotassium Phosphate are the buffering agents. Sodium Chloride maintains the osmotic balance of the medium.

Formula / Liter
Tryptose ................................................................. 20 g
Lactose ........................................................................ 5 g
Bile Salts Mixture ......................................................... 1.5 g
Dipotassium Phosphate .................................................. 4 g
Monopotassium Phosphate ........................................... 1.5 g
Sodium Chloride ......................................................... 5 g
Final pH: 6.9 ± 0.2 at 25°C
Formula may be adjusted and/or supplemented as required to meet performance specifications.

Precautions
1. For Laboratory Use Only.
2. IRRITANT. Irritating to eyes, respiratory system, and skin.

Directions
1. Dissolve 37 g of the medium in one liter of purified water.
2. Mix thoroughly.
3. Distribute into tubes containing inverted fermentation Durham tubes.
4. Autoclave at 121°C for 15 minutes.

Quality Control Specifications
Dehydrated Appearance: Powder is homogeneous, free flowing, and light beige.
Prepared Appearance: Prepared medium is brilliant to clear.
1X Solution: Gold
2X Solution: Medium to dark orange amber
Precipitate: None to light
Expected Cultural Response: With reference to the FDA/BAM Chapter 4, Enumeration of Escherichia coli and the Coliform Bacteria (update 2/2013) and APHA Standard Methods for the Examination of Water and Wastewater 20th Edition Section 9221: Two inoculation methods can be followed:

- Direct inoculation of test strains into EC Medium with incubation at 35±2°C and at 44.5±0.2°C. Incubate cultures in an aerobic atmosphere at indicated temperature and then examine for growth and gas at 24 ± 2 hours; if no gas re-incubate to 48 ± 3 hours to confirm gas.

- Pre-enrich test strains in LTB (Lauryl Tryptose Broth) at 35±2°C. If no growth/gas after 24 hours, re-incubate up to 48 hours and transfer a loopful of LTB enriched culture to EC Medium and incubate in a water bath at 44.5 and 45.5°C aerobically. Examine for growth and gas at 24 ± 2 hours; if no gas re-incubate to 48 ± 3 hours to confirm gas.

The organisms listed are the minimum that should be used for quality control testing.

**Test Procedure**
Refer to appropriate references for specific procedures using EC Medium.²⁻⁵

**Results**
Gas production with growth in EC Medium within 48 ± 3 hours or less is considered a positive fecal coliform reaction. Failure to produce gas with little or no growth is a negative reaction.²

**Storage**
Store sealed bottle containing the dehydrated medium at 2 - 30°C. Once opened and recapped, place container in a low humidity environment at the same storage temperature. Protect from moisture and light by keeping container tightly closed.

**Expiration**
Refer to expiration date stamped on the container. The dehydrated medium should be discarded if not free flowing, or if the appearance has changed from the original color. Expiry applies to medium in its intact container when stored as directed.

**Limitation of the Procedure**
Due to varying nutritional requirements, some strains may be encountered that grow poorly or fail to grow on this medium.
